PERCUTANEOUS CORONARY INTERVENTION CONSENT

PLEASE READ THE FOLLOWING INFORMATION

Percutaneous Coronary Intervention (PCI) involves the dilatation of a narrowed portion of a coronary artery by insertion of a small balloon catheter via a peripheral artery (usually the femoral artery).

In brief, you will be given a sedative prior to the procedure and the Doctor will inject local anaesthetic into the skin in the groin area (or occasionally in the arm). Once the skin has been anaesthetised a tube is placed in the artery and / or vein. A fine wire is introduced into the coronary artery and positioned across the narrowed segment into the distal vessel. A balloon is inserted through a guiding catheter and is positioned across the narrowed lesion by tracking over the guidewire. The balloon is then inflated. At the same time a stent may be placed to support the coronary artery. This procedure alleviates the narrowing and restores blood flow to the area of the heart previously deprived by the narrowed or occluded artery.

An Iodine based radiographic dye (contrast) is injected into the arteries and / or heart and X-ray pictures are taken. It is imperative that you inform the Nursing and Medical staff if you have had any previous allergic reaction to dye / contrast.

In the majority of cases PCI is safe and well tolerated but there are certain risks about which you will need to be informed of. There is a moderate risk of bruising around the puncture site and / or bleeding. This risk is increased if you are overweight or have high blood pressure. There is a 1 in 200 chance of the procedure damaging the coronary artery requiring emergency Coronary Artery Bypass Surgery. You will need to be transferred to another hospital for this operation. When the balloon is inflated you may expect some chest pain during the procedure but the risk of a significant heart attack is minor (a 1 in 100 chance). There is a small risk of infection (1 in 1000 chance). There is a small risk of a major complication including stroke and death.

These procedural risks will vary between individuals and depend on pre-existing risk factors and medical conditions so please discuss these issues with your Doctor if you are concerned. Your Cardiologist believes that the benefit of the procedure outweighs the risks outlined. Our outcomes are compared every 6 months with a national database administered by the Australian Council on Healthcare Standards (ACHS).

For this procedure we may have supplier representatives present to assist during the procedure.

CONSENT

I have read the above information and had the opportunity to ask questions and I am happy with the response. I hereby give my consent to undergo Percutaneous Coronary Intervention +/- stent implantation and Coronary Artery Bypass Surgery.
